PARTH SETHI

Senior Software Engineer

Seattle, WA | +1 (352) 745-9455 | sethiparth.ps@gmail.com | https://linkedin.com/in/parth-sethi-a24753b7 | https://sethiparth.github.io

SUMMARY

Senior Software Engineer with 6+ years in system design and high-throughput, fault-tolerant distributed systems and gRPC microservices. Architected and led the rendering engine for a $1B+ revenue channel, coordinated the cross-team effort to launch it, drove a 10x throughput gain, and raised its availability to 99.999%. Experience spans AWS and Salesforce.

PROFESSIONAL EXPERIENCE

Salesforce **May 2022 - Present**

Senior Software Engineer (SMTS), Seattle, WA

- **Architected "Sage" from scratch**, a two-step gRPC microservices rendering engine replacing the legacy E360 platform. Where the legacy library was a thin, low-level wrapper over Handlebars.js, Sage is a higher-order engine with deep, composable helpers; shipped two releases ahead of schedule.
- Led a cross-org effort across **Q3 and Q4**, coordinating **4+ teams** and their dedicated test campaigns to clear Sage for launch - surfacing and fixing issues that hardened performance under peak request rates and heavy load.
- Led and orchestrated the migration of **100% of customers** onto Sage with no downtime and no customer action required, reaching 100% functional parity via a custom Compatibility Testing Framework built with Product.
- **Set the reference architecture** now shared across **3 channels** (SMS, email, RCS) as one engine - driving the design reviews and standards other teams build against.
- **Built an agentic automation pipeline (Claude)** that replaced a manual **~4-hour-per-org** workflow - org provisioning, preview/real email sends, and integration + daily health tests - reclaiming multiple engineer-weeks per quarter.
- Drove a **10x throughput gain** (4M to 40M emails/hour) via DynamoDB batch tuning and Redis caching and deduplication, plus bulk operations with quota-aware entitlements for partial sends under load.
- **Built a pre-deploy validation framework** that caught regressions before rollout, sustaining a **99.999%** monthly service-availability SLO; on call, cut incident response load and PagerDuty alerts by 10+/week.

Amazon Web Services (AWS) **Oct 2019 - May 2022**

Software Development Engineer, Seattle, WA

- **Rearchitected the EC2 maintenance service** to fire "reboot" instance events across 25 public regions, protecting **556,000+** customers' instance data on degraded hardware.
- **Redesigned EC2 maintenance scheduling** with a best-fit algorithm, eliminating daily manual scripts and cutting "no time slot" errors by 100s every two weeks.
- **Automated manual maintenance escalations** on internal EC2 fleets, removing **4,000 escalations/year** and hundreds of engineer-hours.
- **Designed a customer-window scheduling algorithm** giving 10,000+ customers control over maintenance timing, plus an EC2 KPI "pain index" to predict and reduce escalations.

OM Partners **Feb 2019 - Oct 2019**

Software Engineer, Atlanta, GA

- **Designed a task-distribution scheduling algorithm** over time buckets from user input, optimizing work-execution rate.
- Implemented optimization strategies in **C++17** for "OPAL," a custom supply-chain inventory and logistics language.

TECHNICAL SKILLS

Languages: Java, C++, SQL, NoSQL (proficient); C#, Scala, Python, Ruby (familiar)

AWS: DynamoDB, Redshift, RDS, S3, Lambda, Kinesis, QuickSight, EC2, CloudWatch, CloudFormation, IAM, KMS, SNS, SQS

Systems & Tools: gRPC, Redis, distributed systems, high-availability design, performance optimization, Git, Agile/Kanban, AI-agent orchestration (Claude, Cursor)

EDUCATION

M.S. Computer Science, University of Florida, Gainesville, FL Aug 2017 - Dec 2018

GPA 3.56 / 4.0

B.Tech Electronics & Communication, Jaypee University of Info. & Tech., Solan, India Aug 2013 - May 2017

GPA 9.1 / 10
